

ILMATAR ENVIRONMENTAL POLICY

The environmental policy of Ilmatar Energy Oy and its affiliates (later collectively referred to as ‘**Ilmatar**’ or ‘**we**’) outlines the goals and principles to which we adhere in our operations and to which we require our partners to adhere. We comply with current legislation and any applicable official regulations in all our operations.

Ilmatar Energy has been committed to the United Nations Global Compact corporate sustainability initiative since 2021. We aim to fulfil the UN’s sustainability objectives in our business activities.

Our goal is to help build a society and a world that runs completely on renewable energy, and we want to realise our goal in the most sustainable way possible. All our business operations have been dedicated to solving one of the most important and challenging issues in the world.

We want to build and own one of the biggest renewable energy production portfolios in Finland and in the Nordic countries. Producing and storing wind power and other renewable energy decreases CO2 emissions in all energy production by replacing fossil fuel-produced electricity and energy in the market. We direct our operations towards reducing our carbon footprint, meaning that we focus on increasing our positive climate impact. We have been calculating our carbon footprint since 2021 and strive to continuously find ways to reduce it.

By delivering renewable energy reliably and cost-effectively, we are at the forefront of energy transition together with our clients and partners. Our project development and construction operations aim to minimise their environmental impact and create extensive, high-quality environmental studies to limit the impact of our operations on various organisms and animal species.

In addition to reducing emissions, we promote circular economy and energy-efficient operational models together with our domestic and global partners. This objective affects everything we do from office work to end-of-life operations of our production assets.

Unlike other traditional project development companies, we are present in all lifecycle phases of our projects. We map out locations, secure financing for projects and supervise the construction and the day-to-day functions of operational wind farms. We believe that this comprehensive involvement provides us the best opportunity to become aware of and transparently and extensively reduce any environmental impact from our projects.

Ilmatar’s board of directors and management are committed to reaching our corporate responsibility objectives and the continuous development of our corporate responsibility. Our corporate responsibility objectives also include environmental goals that are actively monitored and reported.

ILMATAR

We focus on training our personnel and also cooperate with our partners in developing our processes. In addition, we assess the environmental risks of our operation and strive to remove or minimise any risk factors where possible.
